L. Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.

CARRY OUT HIGH-APPINITY BINDING AND ENERGY DEPENDENT UPTAKE INTO THE PERIPLASMIC SPACE OF SPECIFIC SUBSTRATES. IT COULD ACT TO TRANSDUCE BENERGY PROCESSES IN THE OUTER MEMBRANE, RESULTING IN THE RELAKING PROCESSES IN THE OUTER MEMBRANE, RESULTING IN THE RELAKING PROCESSES IN THE OUTER MEMBRANE, RESULTING IN THE RELAKING PROTEINS OF LIGANDS BOUND BY THESE OUTER MEMBRANE PROTEINS (BY SIMILARITY).

C.: SUBCELLULAR LOCATION: ANCHORED TO THE CYTOPLASMIC MEMBRANE VIA ITS N-TERMINAL SIGNAL-LIKE SEQUENCE, SPANS THE PRIPLASM (BY SIMILARITY).

C.: SIMILARITY: BELONGS TO THE TONB FAMILY.

Nat. Struct. Biol. 6:785-792(1999).

-!- FUNCTION: THE BRANCHED-CHAIN ALPHA-KETO DEHYDROGENASE COMPLEX
CATALYZES THE OVERALL CONVERSION OF ALPHA-KETO ACIDS TO ACYL-COA
AND CO(2). IT CONTAINS MULTIPLE COPIES OF 3 ENZYMATIC COMPONENTS:
BRANCHED-CHAIN ALPHA-KETO ACID DECARBOXYLASE (E1), LIPOAMIDE
ACYLTRANSFERASE (E2) AND LIPOAMIDE DEHYDROGENASE (E3).

-!- CATALYTIC ACTIVITY: 3-methyl-2-oxobutanoate + lipoamide = S-(2-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Brown D., Churcher C.M., Barrell B.G., Rajandream M.A., Wood V.;

"Cloning and sequence analysis of the genes encoding the alpha and beta subunits of the El component of the pyruvate dehydrogenase multienzyme complex of Bacillus stearothermophilus.";
Eur. J. Biochem. 191:337-346(1990).
-!- FUNCTION: THE PRIVATE DEHYDROGENASE COMPLEX CATALYZES THE OVERALL CONVERSION OF PYRUVATE TO ACETYL.-COA & CO(2). IT CONTAINS MULTIPLE COPIES OF THREE ENZYMATIC COMPONENTS: PYRUVATE DEHYDROGENASE (El).
DIHYDROLIPOAMIDE ACETYLTRANSFERASE (E2) & LIPOAMIDE DEHYDROGENASE (E1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: TRANSCRIPTIONAL ACTIVATOR FOR THE CBB OPERON (CBBLSXFP) FOR ROBLISCO AND OTHER CALVIN CYCLE GENES. BINDS SPECIFICALLY TO TWO BINDING SITES IN THE CBBR-CBBL INTERGENIC REGION.
SIMILARITY: BELONGS TO THE LYSR FAMILY OF TRANSCRIPTIONAL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EQUENCE FROM N.A.

Liu B., Aronson N.N. Jr.;

Structure of the human gene for lysosomal di-N-acetylchitobiase.";

Submitted (AUG-1998) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: INVOLVED IN THE DECRADATION OF ASPRAGINE-LINKED

GIYCOPROTEINS. HYDROLYZE OF N-ACETYL-BETA-D-GLUCOSAMINE

(1-4)N-ACETYLGLUCOSAMINE CHITOBIOSE CORE FROM THE REDUCING END

OF THE BOND, IT REQUIRES PRIOR CLEAVAGE BY GLYCOSYLASPARAGINASE.

-!- SUBCELLULAR LOCATION: Lysosomal.

-!- SIMILARITY: BELONGS TO FAMILY 18 OF GLYCOSYL HYDROLASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fisher K.J., Aronson N.N. Jr., "Cloning and expression of the cDNA sequence encoding the lysosomal glycosidase di-N-acetylchitcbiase."; J. Biol. Chem. 267:19607-19616(1992).

Brown K.E., Lawrence R., Sonenshein G.E.;

Concreted modulation of alpha 1(XI) and alpha 2(V) collagen mRNAs in borine vascular smooth muscle cells.;

J. Biol. Chem. 266:23268-23273(1991).

-! FURLILOGENESIS BY

CONTROLLING LATERAL GROWTH OF COLLAGEN IN FIBRILLOGENESIS BY

ALPHA 2(XI), AND ALPHA 3(XI). ALPHA 1(V) CAN ALSO BE FOUND INSTEAD

CONTROLLING ALPHA 3(XI). ALPHA 1(V) CAN ALSO BE FOUND INSTEAD

OF ALPHA 3(XI)-1(I) (BY SIMILARITY).

CONTROLLINGS AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING

OUT IT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.

CONTROLLINGS TO THE FIBRILLAR CLASS OF COLLAGENS.

CONTROLLINGS TO THE FIBRILLAR CLASS OF COLLAGENS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

ACT_SITE 278 278 TRANSIENT COVALENT LINKAGE TO DNA DURING STRAND CLEAVAGE AND REJOINING (BY
                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                       -!- FUNCTION: Participates in site-specific recombination. Acts by catalyzing the cutting and rejoining of the recombining DNA molecules. Acts jointly with XerD (By similarity).
-!- SIMILARITY: BELONGS TO THE "PHAGE" INTEGRASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       P21881; 059227;

Rossi P., de Crombrugghe B.; percific transcriptional enhancer in the first intron of a call-specific transcriptional enhancer in the first intron of the mouse alpha 2 (type I) collagen gene."; proc. Natl. Acad. Sci. U.S.A. 84:5590-5594(1987).

-!- FUNCTION: TYPE I COLLAGEN IS A MEMBER OF GROUP I COLLAGEN (FIBRILLAR FORMING COLLAGEN).

-!- SUBGUIT: TRIMERS OF ONE ALPHA 2(I) AND TWO ALPHA 1(I) CHAINS.

-!- SIBGUIT: TRIEST FORMS THE FIBRILS OF TENDON, LIGAMENTS AND BONES. IN BONES THE FIBRILS ARE MINERALIZED WITH CALCIUM
Mus musculus (Mouse).
